Flickering

Source: https://en.wikipedia.org/wiki/Interlaced_video

Line interlacing

Example for interlacing

Upper field (top) - all odd lines (1,3,5,7, etc.) are drawn first.

Lower field (bottom) - now all even lines (2,4,6,8, etc.) are drawn.

As looking at the TV one recognizes a picture like the one above.

Number of lines on TV

$$3 \times 3 \times 3 \times 3 \times 5 = 405 \quad (\text{United Kingdom})$$

$$3 \times 5 \times 5 \times 7 = 525 \quad \text{USA, Japan, ...}$$

$$5 \times 5 \times 5 \times 5 = 625 \quad \text{EU, Australia, Africa, Asia, ...}$$

$$3 \times 3 \times 7 \times 13 = 819 \quad (\text{France})$$

Color difference signals

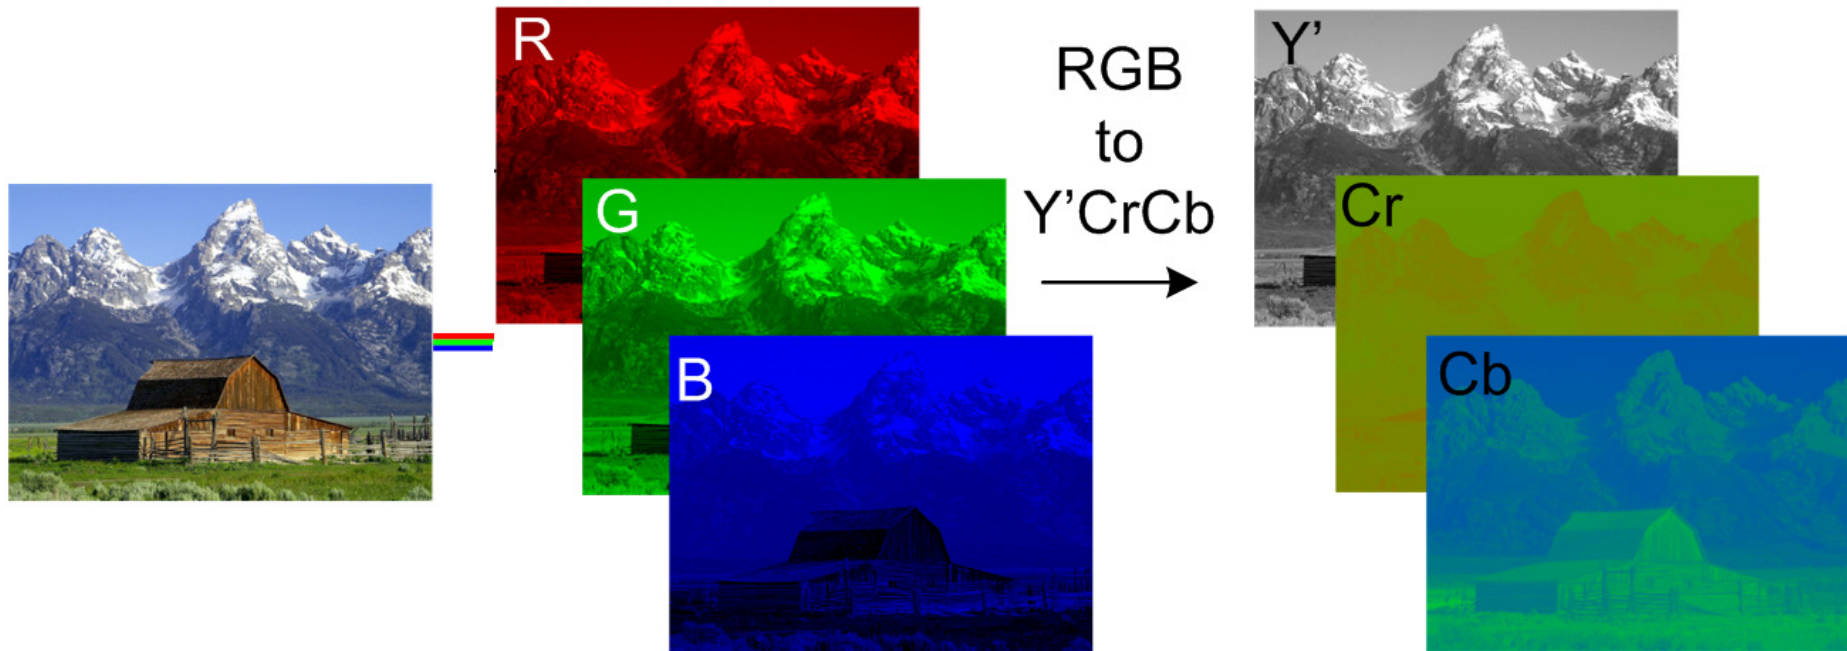

$$Y = 0.3 \cdot R + 0.59 \cdot G + 0.11 \cdot B$$

$$-(R - Y) = \frac{0.59}{0.3} \cdot (G - Y) + \frac{0.11}{0.3} \cdot (B - Y)$$

$$-(G - Y) = \frac{0.3}{0.59} \cdot (R - Y) + \frac{0.11}{0.59} \cdot (B - Y)$$

$$-(B - Y) = \frac{0.3}{0.11} \cdot (R - Y) + \frac{0.59}{0.11} \cdot (G - Y)$$

C_R and C_B

PAL, NTSC, SECAM color difference signals

- PAL:

$$-Y + \mathbf{QAM}\{u, \pm v\}$$

$$u = \frac{(B - Y)}{2.03}$$

$$v = \frac{(R - Y)}{1.14}$$

- NTSC:

$$-Y + \mathbf{QAM}\{I, Q\}$$

$$I = -u \cdot \sin(33^\circ) + v \cdot \cos(33^\circ)$$

$$Q = +u \cdot \cos(33^\circ) + v \cdot \sin(33^\circ)$$

- SECAM:

$$-Y + \mathbf{FM1}\{u\} \setminus \mathbf{FM2}\{v\}$$

Baseband time function of the analog TV

Analog TV systems by nation

Gamma correction

	0.1	0.2	0.3	0.4	0.5	0.6	0.7	0.8	0.9	1.0
	0.1	0.2	0.3	0.4	0.5	0.6	0.7	0.8	0.9	1.0

DIGITAL TV

- Video Compression as Fast As Possible
- [Video](#)
- <https://www.youtube.com/watch?v=qbGQBT2Vwvc>

DVB-C (Cable / Community)

- cable provider
 - change some analog channels to digital
 - use same 8 MHz raster
- 8 MHz, QAM-64 (6 bit/symbol)
- elementary function: 15% raised cosine
- 6 MBaud signal, 38 Mbps multiplex channel
 - HD: ~6-8 Mbps required
 - SD: ~2 Mbps required
 - several HD and SD channels on the 8 MHz raster

DVB-S (Satellite)

- worse SNR than DVB-C
- QPSK modulation
- same 38 Mbps multiplex channel as in DVB-C
 - requires 37 MHz
 - (no problem, in GHz region)
- for sparsely populated areas

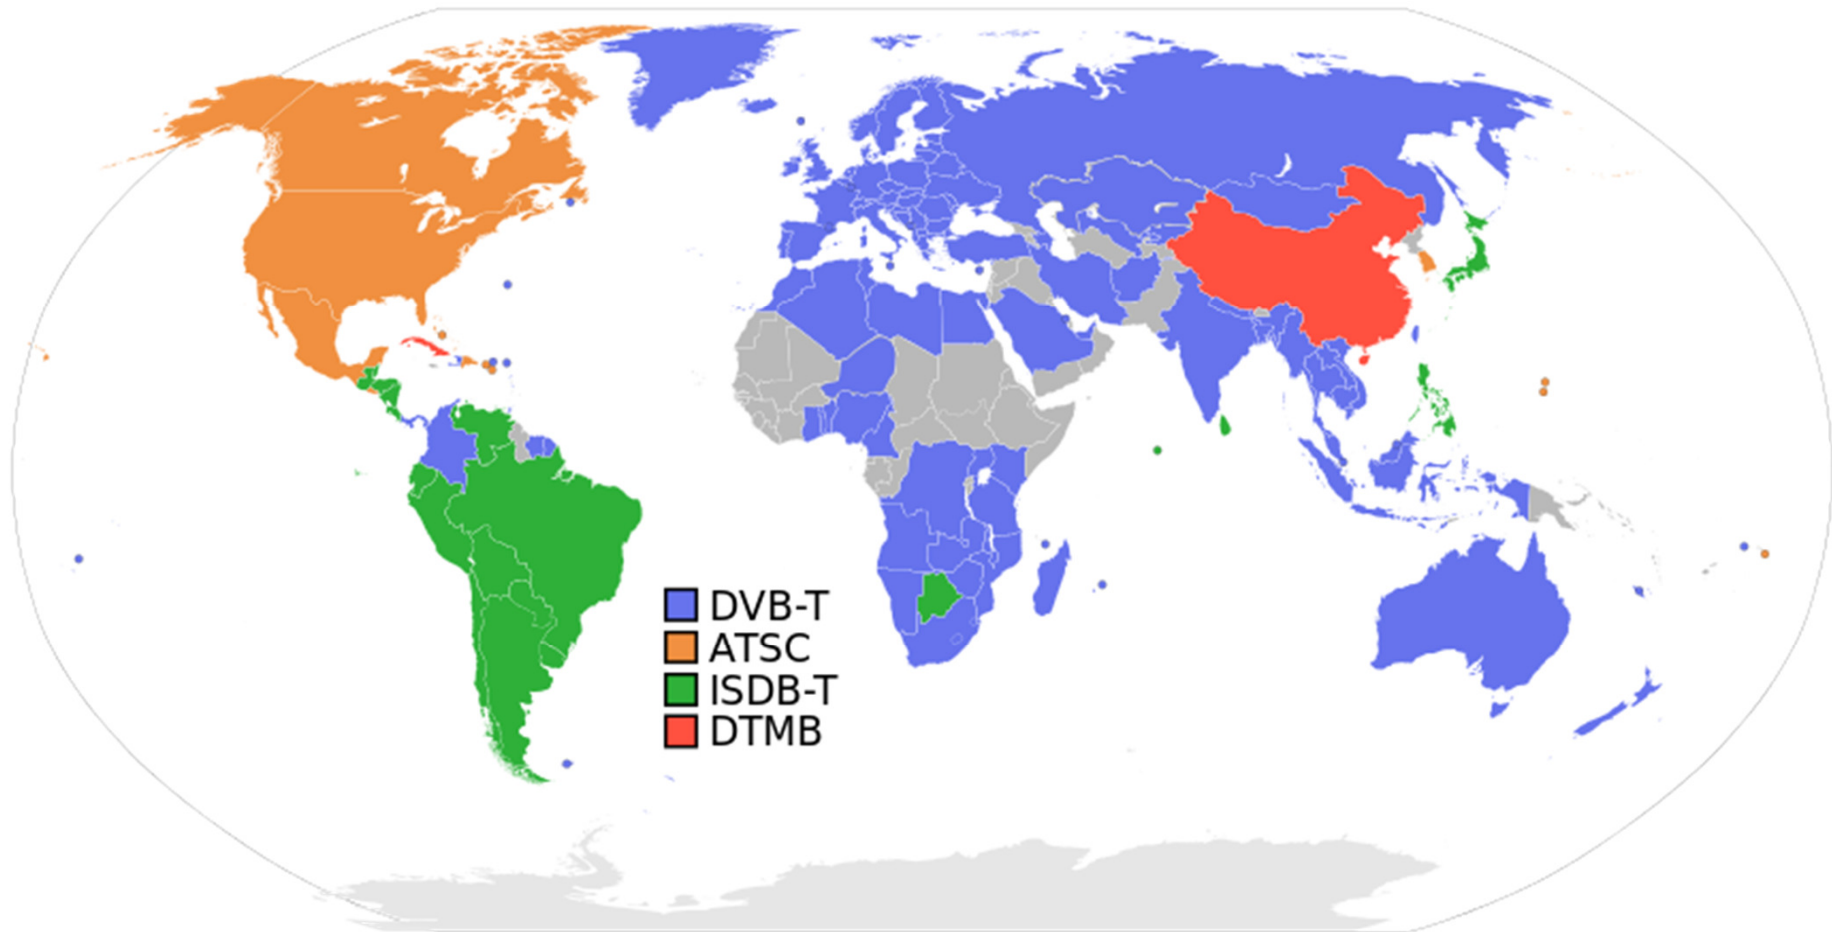

DVB-H (Handheld)

- Mobile TV
- access to service while in moving vehicle
- display size: larger postal stamp
- tuner consumes much power
- not widespread (lack of business model)

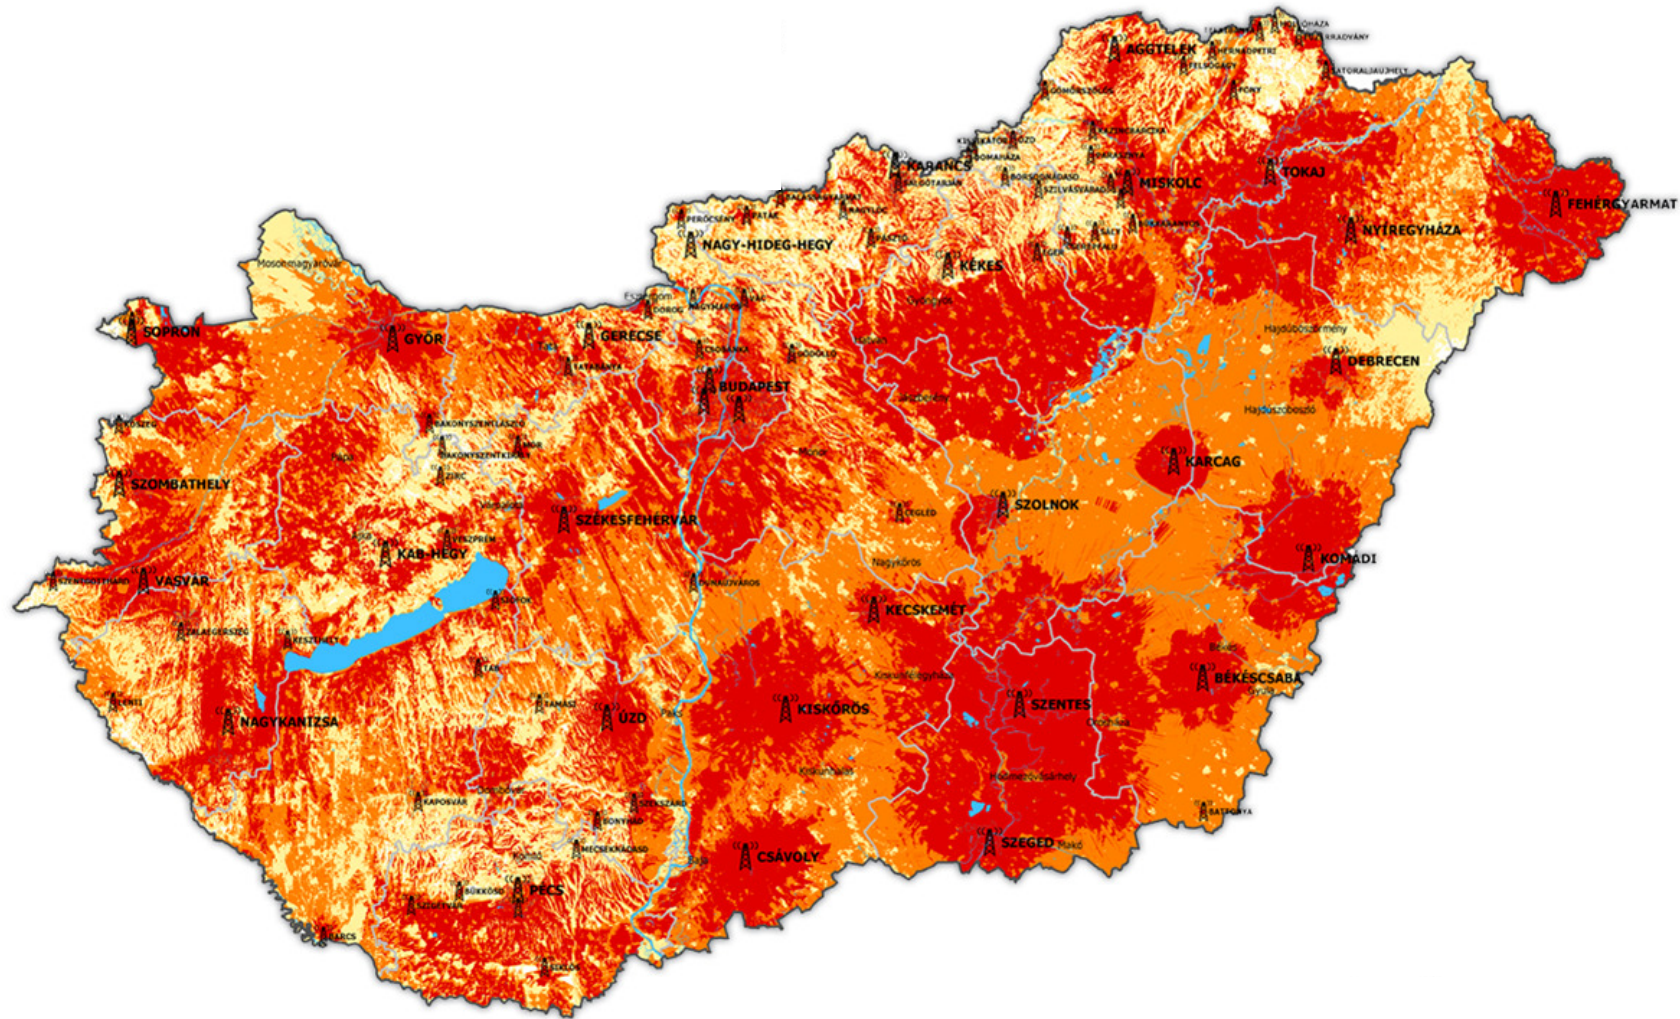

DVB-T (Terrestrial)

- problems:
 - multipath propagation, dispersion
 - ISI (vs. analog: ghost image)
- Forward error correction
- Cyclic error correction
 - Reed-Solomon code, RS(204, 188)
- OFDM with ~6000 subcarriers
 - QAM-16
- different from country to country
 - Hungary: MPEG-4, H.264 source coding
